

BSI Standards Publication

Safety requirements for bonded abrasive products

National foreword

This British Standard is the UK implementation of EN 12413:2019. It supersedes BS EN 12413:2007+A1:2011, which is withdrawn.

The UK participation in its preparation was entrusted to Technical Committee MTE/13, Grinding wheels, abrasive tools, paper and cloths, and powders.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

English Version

Safety requirements for bonded abrasive products

Exigences de sécurité pour les produits abrasifs
 agglomérés

Sicherheitsanforderungen für Schleifwerkzeuge aus
 gebundenem Schleifmittel

This European Standard was approved by CEN on 5 August 2019.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

European foreword

This document (EN 12413:2019) has been prepared by Technical Committee CEN/TC 143 "Machine tools — Safety", the secretariat of which is held by SNV.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by April 2020, and conflicting national standards shall be withdrawn at the latest by April 2020.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

This document supersedes EN 12413:2007+A1:2011.

Significant technical differences between EN 12413:2007+A1:2011 and EN 12413:2019 are as follows:

- a) Clause 3 "Terms and definitions" has been revised;
- b) several modifications throughout the document have been done due to a change of concept regarding the terms "grinding" and "cutting-off" where the expression "grinding" does not include "cutting-off" anymore;
- c) the abbreviation "RE" for the "Restrictions of use" has been deleted;
- d) the type names in Table 6 have been checked and updated (the new edition of ISO 525 that is still under preparation will also include these revised types);
- e) in Table 6, the new Types 17R, 18B, 18P and 19R have been added;
- f) 6.2 "Scope of inspection by the manufacturer" has been moved to an informative Annex F "Recommended scope of the in-process inspection";
- g) in Annex A, requirements for safety symbols (including symbols for personal protective equipment) have been added;
- h) in Table A.2, the following 'restrictions to use' including safety symbols have been added: "Only for grinding at an angle greater than 10°". For the 'restriction to use' "Only permitted for totally enclosed working areas", a safety symbol has been added;
- i) a new Table A.3 with symbols for personal protective equipment and a new safety symbol for "Do not use a damaged abrasive wheel" has been added;
- j) the three point side load test in C.3 has been deleted;
- k) Bibliography has been updated.

According to the CEN-CENELEC Internal Regulations, the national standards organisations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Introduction

This document has been prepared to provide one means of conforming with essential safety requirements, e.g. of the General Product Safety Directive and associated EFTA regulations.

This document is addressed to designers, manufacturers and suppliers of the abrasive products described in the scope. In addition, it helps designers, manufacturers and suppliers of grinding machines in the selection of abrasive products, in order to reduce the risks and achieve conformity of the respective machinery with the essential health and safety requirements of the Machinery Directive.

The extent to which hazards are covered is indicated in the scope of this document.

1 Scope

This document is applicable to rotating bonded abrasive products. It specifies requirements and/or measures for the removal or reduction of hazards resulting from the design and application of the abrasive products.

This document also contains procedures and tests for verification of compliance with the requirements as well as safety information for use, which is to be made available to the user by the manufacturer.

This document does not apply to superabrasive products and coated abrasive products.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN ISO 6103, *Bonded abrasive products - Permissible unbalances of grinding wheels as delivered - Static testing (ISO 6103)*

ISO 525, *Bonded abrasive products — General requirements*

ISO 13942, *Bonded abrasive products — Limit deviations and run-out tolerances*

3 Terms, definitions and symbols

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1 General

3.1.1

bonded abrasive product

product consisting of abrasive grains held together by a bond

EXAMPLE Typical abrasive grains are aluminium oxide or silicon carbide.

Note 1 to entry: Types of bonded abrasive products are defined in ISO 525.

3.2 Grinding and cutting-off machines

3.2.1

stationary machine

machine being fixed in position during operation

Note 1 to entry: See for example EN ISO 16089.

Note 2 to entry: Included are fixed swing frame machines and mobile machines clamped firmly in position during use.

Note 3 to entry: Transportable machines are fixed in position during operation and therefore considered to be stationary machines.

3.2.2

stationary machine with totally enclosed working area

stationary machine being protected by separating guards in such a way that machining processes are carried out inside them and persons are protected against hazards

3.2.3

mobile machine

machine not being fixed in position during operation

Note 1 to entry: Mobile machines are manually guided (but not hand-held) by the operator during use, e.g. floor grinding machines.

3.2.4

hand-held machine

machine being held in the hand during operation

Note 1 to entry: Included are machines with flexible drives.

3.3 Grinding and cutting-off methods

3.3.1

peripheral grinding

grinding with the periphery of the wheel with no or limited side loads

3.3.2

face grinding

grinding with the face of the wheel

3.3.3

cutting-off

cutting or slotting with the periphery of the cutting-off wheel

3.3.4

high pressure grinding

grinding with high contact pressure for steel conditioning

3.4 Type of application

3.4.1

mechanically guided grinding and cutting-off

process with feed movements of the abrasive product and/or the workpiece guided by mechanical means

Note 1 to entry: See Table 1.

3.4.2

manually guided grinding and cutting-off

process with feed movements of the abrasive product and/or the workpiece manually guided by the operator

Note 1 to entry: See Table 1.

3.4.3

hand-held grinding and cutting-off

process with the grinding or cutting-off machine entirely guided by the operator

Note 1 to entry: See Table 1.

Table 1 — Type of application

Type of machine	Type of application	Abrasive product	Workpiece
Stationary machines and stationary machines with totally enclosed working area	Mechanically guided grinding and cutting-off	Fixed	Mechanically guided
		Mechanically guided	Fixed
		Mechanically guided	Mechanically guided
Stationary and mobile machines	Manually guided grinding and cutting-off	Guided by the operator	Fixed
		Fixed	Guided by the operator
Hand-held machines	Hand-held grinding and cutting-off	Guided by the operator	Fixed

3.5 Symbols

For the purposes of this document, the symbols listed in Table 2 apply.

Table 2 — Symbols

Symbol	Designation	Definition	Unit
A	Impact resistance	Resistance of a rotating abrasive product to lateral impact	Nm
f_{br}	Bursting speed factor	Bursting speed divided by maximum operating speed: $f_{\text{br}} = \frac{v_{\text{br}}}{v_s}$	—
f_{pr}	Test speed factor	Safety test speed divided by maximum operating speed: $f_{\text{pr}} = \frac{v_{\text{pr}}}{v_s}$	—
F_{S1}	Single point side load	Resistance of a rotating abrasive product to lateral single point load	N
n_{ab}	Deflection speed of mounted points	Revolutions per minute at which the spindle of mounted points is deflecting under centrifugal force	1/min
n_{max}	Maximum permissible speed of rotation	Revolutions per minute of a new abrasive product at maximum operating speed	1/min

Symbol	Designation	Definition	Unit
S_{ab}	Safety factor against spindle deflection for mounted points	Deflection speed divided by maximum permissible speed of rotation: $S_{ab} = \frac{n_{ab}}{n_{max}}$	—
S_{br}	Safety factor against bursting due to centrifugal force	Bursting speed divided by maximum operating speed, all squared: $S_{br} = \left(\frac{v_{br}}{v_s} \right)^2$	—
v_s	Maximum operating speed	Maximum permissible peripheral speed of a rotating abrasive product	m/s
v_{pr}	Safety test speed	Peripheral speed at which abrasive products are tested by the manufacturer	m/s
v_{br}	Bursting speed	Peripheral speed at which an abrasive product breaks due to centrifugal force	m/s
$v_{br, min}$	Minimum bursting speed	Peripheral speed which an abrasive product shall at least reach without bursting due to centrifugal force	m/s

4 List of significant hazards

The significant hazards are listed in Table 3.

Table 3 — List of significant hazards

Hazard designation	Hazardous situation (Examples)	Relevant clauses in this standard
Ejection of parts	1. Abrasive product breakage caused by	—
	— improper design	5.1, 5.2, 5.3 and Annex C
	— manufacturing defects	5.1
	— wrong selection	5.5, Clause 7 and Annex A
	— improper handling and storage	Clause 7
	— improper use (mounting and grinding process)	5.6, Clause 7 and Annex A
	2. Grinding debris	Clause 7
Vibration	Hand arm vibration on hand-held machines caused by	—
	— manufacturing defects	5.3 and 5.4
	— improper use	Clause 7
	— incorrect mounting	Clause 7

Hazard designation	Hazardous situation (Examples)	Relevant clauses in this standard
Kickback	Kickback effect of cutting-off wheels on hand-held machines caused by:	—
	— improper use	Clause 7
	— improper design	5.1, 5.2, 5.3 and Annex C
	— manufacturing defects	5.1
	— wrong selection	5.5, Clause 7 and Annex A
	— improper handling and storage	Clause 7

5 Safety requirements

5.1 General requirements

5.1.1 General

Abrasive products shall be designed and manufactured in such a way that they resist the forces and loads that are to be expected when used as intended. They shall not present visible faults and shall comply with the requirements listed in the following clauses.

5.1.2 Sequence of maximum operating speeds

Abrasive products shall be manufactured for maximum operating speeds according to the following sequence:

< 16 — 16 — 20 — 25 — 32 — 35 — 40 — 45 — 50 — 63 — 80 — 100 — 125 in m/s

The only exception to this is where the application requirements dictate an intermediate speed.

The manufacturer may select any of these speeds up to the maximum values shown in Table 6.

NOTE For conversion of peripheral speeds into speeds of rotation for different outside diameters D of the abrasive product, see Annex E.

5.2 Strength requirements

5.2.1 Safety factors

Abrasive products — with the exception of mounted points and wheels — shall have a safety factor against bursting due to centrifugal forces at their maximum operating speed as given in Table 4.

Table 4 — Safety factors

Type of machine	Type of abrasive product	Maximum operating speed v_s m/s	Safety factor s_{br}	Bursting speed factor f_{br}
Stationary machines	high pressure grinding wheels	≤ 80	3,50	1,87
	cutting-off wheels, manually guided cutting-off	≤ 100	3,50	1,87
	cutting-off wheels, only mechanically guided cutting-off	≤ 100	2,00	1,41
	all other types	all	3,00	1,73
Stationary machines totally enclosed	high pressure grinding wheels	≤ 100	3,00	1,73
	all other types	all	1,75	1,32
Mobile machines	grinding and cutting-off wheels	≤ 100	3,50	1,87
Hand-held machines	grinding wheels $D > 125$ mm	≤ 50	3,00	1,73
		$50 < v_s \leq 80$	3,50	1,87
	cutting-off wheels $D > 125$ mm	≤ 100	3,50	1,87
	all types $D \leq 125$ mm	≤ 80	3,00	1,73
		> 80	3,50	1,87

5.2.2 Safety factors for mounted points and wheels

Mounted points and wheels shall have a safety factor against bursting due to centrifugal forces of $s_{br} = 3$ at their maximum operating speed. The spindle shall have a safety factor against deflection of $s_{ab} = 1,3$. For further requirements, see Annex B.

5.2.3 Side load capacity

Depressed-centre wheels, straight cutting-off wheels and depressed-centre cutting-off wheels for the use on hand-held machines shall have a side load capacity according to Table 5.

Table 5 — Side load capacity of abrasive products for use on hand-held machines

Abrasive product	Maximum operating speed v_s m/s	Outside diameter D mm	Side load capacity	
			Single point side load F_{S1} N	Impact resistance A Nm
Depressed-centre grinding wheels (type 27a,b and type 28a,c)	≤ 80	≥ 115	290	—
		150	290	4,5
		180	290	5,4
		230	290	6,9
Straight and depressed-centre cutting-off wheels (type 41 ^a and type 42 ^a)	≤ 80	≥ 115	40	—
		150	50	1,2
		180	50	1,5
		230	50	2,0
		300	125	5,4
		350/356	125	5,4
		400/406	125	5,4
Straight cutting-off wheels (type 41 ^a)	$80 < v_s \leq 125$	$115 < D \leq 125$	40	—
	$80 < v_s \leq 100$	300	125	5,4
		350/356	125	5,4
		400/406	125	5,4

a According to ISO 525.
 b With back-up pad where intended for the type of application.
 c Tested as a type 27.

5.3 Dimensional requirements

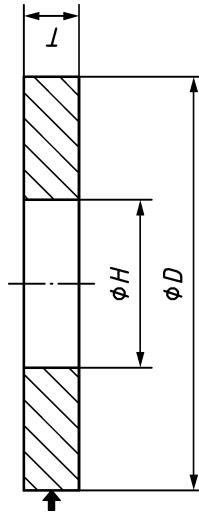

5.3.1 Dimensional limitations and maximum operating speeds

Bonded abrasive products shall comply with the dimensional limitations and maximum operating speeds as specified in Table 6.

NOTE The arrow in the figures in Table 6 symbolizes the working face of the bonded abrasive product.

Table 6 — Dimensional limitations and maximum operating speed

Shape, designation, dimensional letters	Type of machine ^a	Type of application ^a	Maximum operating speeds and dimensional limitations

5.3.2 Limit deviations and run-out tolerances

All products shall conform to the values specified in ISO 13942 as far as they are listed therein.

5.4 Admissible unbalance

All products for the use on hand-held machines shall conform to the values specified in EN ISO 6103 as far as they are listed therein.

5.5 Marking

Abrasive products shall be marked according to Annex A.

5.6 Blotters

Blotters shall be supplied by the manufacturer, supplier or importer where these are required for a safe mounting and use of the abrasive product.

Blotters shall be made of suitable compressible material. Shape, dimensions and material shall be adapted to application and intended use. When water-based coolants are used the blotter material shall not be affected in the way that it loses its compressibility and physical function.

Blotters can serve as a label for the marking provided the marking requirements of this standard are met and the blotter is firmly attached to the wheel.

6 Verification of the safety requirements

6.1 Verification of the general requirements

6.1.1 General

Abrasive products shall be tested at a level sufficient to confirm consistent conformance to the requirements of the standard (example see Annex F).

6.1.2 Visual inspection

Abrasive products shall be inspected for visual defects. Damaged abrasive products shall be destroyed.

6.1.3 Ring test

The ring test shall be performed on vitrified abrasive products with $D > 80$ mm, with the exception of cemented and nut inserted abrasive products.

In the ring test the abrasive products are tapped with a non-metallic object. An undamaged abrasive product produces a clear tone, a damaged abrasive product a dull or rattling tone.

6.1.4 Safety speed test

The safety speed test serves for the identification of faults with significant effects on the strength of the abrasive product. In the safety speed test the bonded abrasive product is mounted in a clamping device on a suitable test rig and loaded with an increasing number of revolutions up to the test speed. For calculating the test speed, see Table 2. For abrasive products with safety factor 1,75 and 2 according to Table 4 the test speed factor is 1,1. For all others products the test speed factor is 1,2.

6.2 Verification of the strength requirements

6.2.1 Verification of the safety factor

Compliance with the safety factor is checked by a centrifugal force test. The abrasive product mounted in a clamping device on a suitable test rig is loaded with steadily increasing speed of rotation by

centrifugal forces up to the minimum bursting speed. The speed of rotation shall be measured with an uncertainty of $\pm 1\%$. The speed of the abrasive product shall be detected and recorded by a suitable device.

For mounted points, the verification is carried out with an overhang length of the spindle of $L_0 = 0$ mm.

The bonded abrasive product passes the test if it reaches the minimum bursting speed without breaking. The bonded abrasive products subjected to the test shall be destroyed.

Verification of the safety factor against deflection of the spindle of mounted points is carried out with the maximum overhang length of the spindle indicated by the manufacturer or, if there is no such indication, with a clamping length of the spindle of 10 mm (calculation according to Annex B).

6.2.2 Verification of side load capacity

Method, see Annex C.

6.3 Verification of the dimensional requirements

Compliance is checked on the basis of the dimensional data and the data in the drawings using suitable measuring means e.g. limit gauge, calliper gauges, electronic measuring machines.

6.4 Verification of the admissible unbalance

Verification by using the methods in EN ISO 6103.

6.5 Verification of the marking

Verification of the marking data is effected by visual inspection.

6.6 Verification of the requirements for blotters

Verification is effected by dimensional and visual inspection.

7 Information for use

The manufacturer, supplier or importer of abrasive products shall bring information on safe application and safety recommendations for correct use of the products to the notice of the user. The information shall contain safety recommendations as follows:

- a) general information about the abrasive products and their properties,
- b) handling and storage,
- c) selection of products for safe and correct use,
- d) conditions to be fulfilled before use of abrasive products,
- e) mounting instructions,
- f) grinding and cutting operations:
 - conditions to avoid,
 - malpractice and incorrect use.
- g) content and meaning of marking and supplied information,
- h) restrictions to use.

Annex A (normative)

Marking

A.1 Content of marking

A.1.1 Marking requirements

In Table A.1 the marking requirements applying for the different abrasive products are indicated with "X".

Table A.1 — Marking of abrasive products

Designation	Specification								
	1 Manufacturer, supplier, importer, trademark	2 Nominal dimensions	3 Specification mark	4 Maximum operating speed^a	5 Maximum permissible speed of rotation of the unused abrasive product	6 Declaration of conformity	7 Restrictions to use	8 Traceability code	9 Safety symbols
Abrasive wheels types 27, 28, 29, 41 and 42 for use on hand-held machines	X	X	X	X	X	X	X	X	X
Segments	X	X	X	—	—	X	—	X	—
Mounted points and wheels	X	X	X	—	X	X	—	X	—
Cones and plugs	X	X	X	X	X	X	—	X	—
Abrasive products with magnesite bond	X	X	X	X	X	X	—	X	—
All others	X	X	X	X	X	X	X	X	—

^a Option: Additional marking with colour code in accordance with Annex D.

To specification 1

Instead of the name of the manufacturer, supplier or importer, their registered trademark may be shown.

To specification 2

Abrasives products	— nominal dimensions in particular the diameter of the bore (e.g. $H = 22,23$ mm for abrasives products to use on hand-held machines) in accordance with ISO 525
Mounted points and wheels	— nominal dimensions, diameter of the spindle and minimum clamping length
Cones and plugs	— nominal dimensions, thread diameter and length of insert
Segments, disc wheels, cylindrical wheels cemented, bolted or clamped to a support plate	— manufacturer's code e.g. drawing number

To specification 3

Specification mark in accordance with ISO 525. Minimum information required: Abrasive type, grain size, grade or hardness, type of bond and use of reinforcement e.g. A46KV, A24SBF.

To specification 5

The speed of rotation marked on the abrasive product should be according to Annex E.

For mounted points and wheels, the maximum permissible speed of rotation as a function of the relevant overhang and the minimum length of spindle within the collet shall be given. An example for a calculation method for the determination of the permissible speeds of rotation is given in Annex B.

To specification 6

For declaration of conformity with the requirements of this standard, the abrasive products shall be marked with:

EN 12413

To specification 7

Abrasives products for which certain grinding procedures, grinding machines and certain applications have to be obeyed shall be marked with the corresponding restrictions to use according to Table A.2.

The restrictions to use shall be given in full length (see Table A.2, column 1) or in the form of a symbol (see Table A.2, column 3).

To specification 8

To ensure traceability and identification, the abrasive products shall be marked with a traceability code which enables to link an individual product to a limited production quantity. The traceability code may be expressed by e.g. a production/batch number, expiry date or series number.

To specification 9

The safety symbols shall be in accordance with EN ISO 7010. See Table A.3.

Table A.2 — Restrictions to use

Restriction to use	Description	Safety symbol
Do not use with hand-held machine	Abrasive product only for use on machines that are not hand-held NOTE This restriction only applies to abrasive products not for use on hand-held machines but capable of being mounted on such machines.	
Do not use for wet grinding and cutting-off	Abrasive product only suitable for dry grinding and cutting-off	
Do not use for grinding	Abrasive product only for cutting-off NOTE This restriction only applies to abrasive products for use on hand-held machines.	
Only permitted for totally enclosed working area	Abrasive product only for use on stationary machines the guarding of which is accepted as TOTALLY ENCLOSED WORKING AREA NOTE See 3.2.2.	
Only permitted with back-up pad	Abrasive product only for use with additional appropriate back-up pad	
Only permitted for grinding at an angle greater than 10°	Not to be used for grinding at an angle less than 10°	
NOTE Colour design of the symbols in accordance with EN ISO 7010 and ISO 3864-2, wherever possible.		

Table A.3 — Safety symbols

Description	Safety symbol
Refer to instruction manual/booklet ^a	
Wear ear protection	
Wear eye protection	
Wear a mask	
Wear protective gloves	
Do not use a damaged abrasive wheel	
NOTE Colour design of the symbols in accordance with EN ISO 7010 and ISO 3864-2, wherever possible.	
^a This safety symbol is recommended but not mandatory.	

A.1.2 Additional inscriptions

A.1.2.1 General

Additional inscriptions on the abrasive products such as ISO type number and manufacturer's product name is permitted provided legibility of the data required according to Table A.1 is not impaired.

A.1.2.2 Abrasive products for hand-held machines

Abrasive products with type of bond B and BF for use on hand-held machines (except mounted points and wheels, plugs and cones) shall be marked with a date of expiry. The date of expiry shall be within 3 years from the date of manufacture. It is expressed as month and year e.g. V04/2021.

Abrasive products for the use on hand-held machines may in addition be marked with information on the type of workable material.

A.1.2.3 Oriented wheels

If wheels need to be mounted in a specific position on the spindle, they shall be marked in such a way as to clearly indicate in this position.

A.1.2.4 Multiple or gang mounted wheels

Wheels to be multiple or gang mounted shall be marked in a manner to ensure they are correctly mounted on the machine spindle, additionally each wheel shall be identified as being part of that set.

A.1.2.5 Magnesite bond

Abrasive products with magnesite bond shall be marked with a date of expiry.

The date of expiry shall be within 1 year from the date of manufacture. It is expressed as month and year e.g. V04/2021.

A.2 Execution of marking

The marking shall be indelible and legible as long as possible.

The marking shall be on the product itself, on a fixed blotter or on a fixed label.

For products with an outside diameter of $D > 80$ mm, when it is not possible to give all specified information on the abrasive product, blotter or label, the abrasive product itself shall at least be marked with the maximum operating speed in so far as the surface and shape of the abrasive product permits.

For products with an outside diameter of $D \leq 80$ mm, and for mounted points and wheels and segments, the specified information may appear on a label fixed to the smallest packaging unit.

Annex B (informative)

Mounted points and wheels

B.1 Example of calculation of the maximum permissible speed of rotation

According to 5.2.2 mounted points and wheels shall have a safety factor against deflection of the spindle of $S_{ab} = 1,3$. The deflection speed of rotation of the spindle strongly depends on the unsupported overhang of the mounted point. In order to ensure compliance with the safety factor for every length of spindle within the collet the maximum permissible speed of rotation shall be given as a function of the unsupported overhang, see A.1.1, "To specification 5".

The maximum permissible speed of rotation as a function of the unsupported overhang may be determined by calculation, with the following relations (used symbols, see Table B.2):

$$S_{ab} = \frac{n_{ab}}{n_{max}} \text{ with } S_{ab} = 1,3 \quad (\text{B.1})$$

and

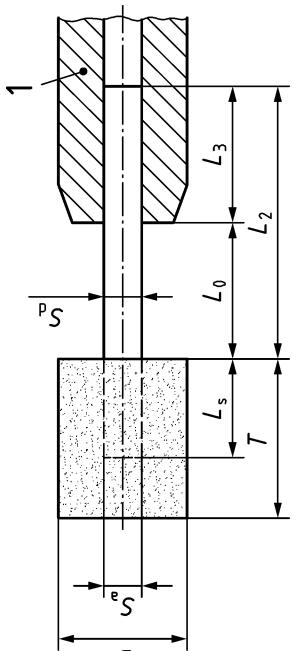

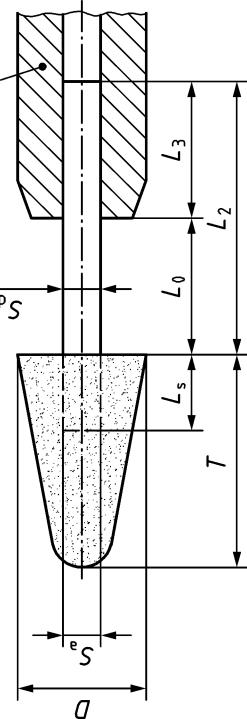

$$n_{ab} = \frac{30}{\pi} \sqrt{\frac{10^6}{\frac{e \cdot M \cdot L_M}{W \cdot R_e} + \frac{M \cdot L_M^3}{3 \cdot E \cdot l}}} \quad (\text{B.2})$$

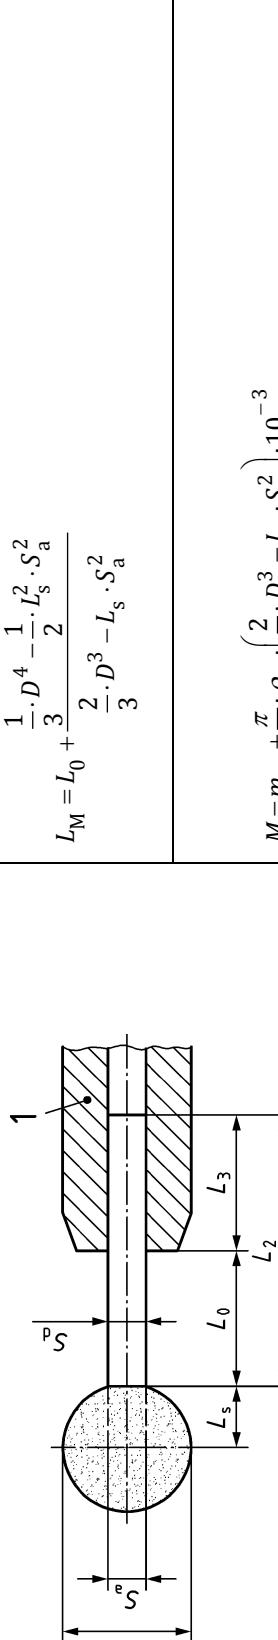

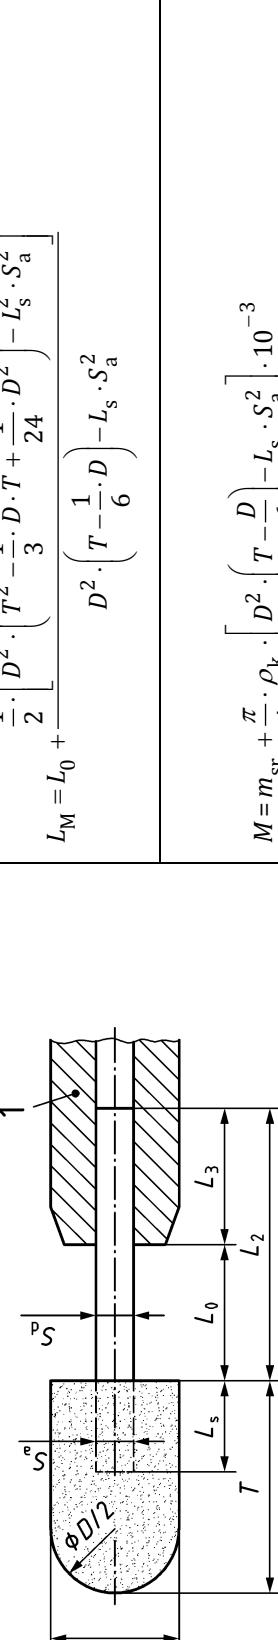

with

$$l = \frac{\pi}{64} \cdot S^4 \text{ and } W = \frac{\pi}{32} S^3 \quad (\text{B.3})$$

The approximate centre of gravity distance L_M and the reduced mass M shall be determined as a function of the shape of the mounted point, see Table B.1.

Table B.1 — Approximate centre of gravity distance L_M and reduced mass M

Mounted points	Gravity distance L_M and reduced mass M
<p>Cylindrical shape</p>  <p>Key 1 Collet</p>	$L_M = L_0 + \frac{D^2 \cdot T^2 - L_s^2 \cdot S_a^2}{2 \cdot D^2 \cdot T - 2 \cdot L_s \cdot S_a^2}$ $M = m_{sr} + \frac{\pi}{4} \cdot \rho_k \cdot \left(D^2 \cdot T - L_s \cdot S_a^2 \right) \cdot 10^{-3}$

Ogival shape	$L_M = L_0 + \frac{D^2 \cdot \left(T^2 - \frac{\sqrt{3}}{2} \cdot D \cdot T + \frac{1}{4} \cdot D^2 \right) - L_s^2 \cdot S_a^2}{2 \cdot \left[D^2 \cdot \left(T - \frac{\sqrt{3}}{4} \cdot D \right) - L_s \cdot S_a^2 \right]}$ $M = m_{sr} + \frac{\pi}{4} \cdot \rho_k \cdot \left[D^2 \cdot \left(T - \frac{\sqrt{3}}{4} \cdot D \right) - L_s \cdot S_a^2 \right] \cdot 10^{-3}$ <p>Key 1 Collet</p>
Taper cup shape	$L_M = L_0 + \frac{0,0852 \cdot D^2 \cdot T^2 - \frac{1}{8} \cdot L_s^2 \cdot S_a^2}{0,11628 \cdot D^2 \cdot T - \frac{1}{4} \cdot L_s \cdot S_a^2}$ $M = m_{sr} + \pi \cdot \rho_k \cdot \left(0,11628 \cdot D^2 \cdot T - L_s \cdot \frac{S_a^2}{4} \right) \cdot 10^{-3}$ <p>Key 1 Collet</p>

Table B.2 — Designation of the calculation quantities

Symbols	Designation	Unit
D	Outside diameter of mounted point	mm
L_0	Unsupported overhang	mm
S_d	Spindle diameter	mm
L_2	Length of spindle	mm
L_3	Clamping length of mounted point	mm
T	Overall thickness of mounted point	mm
E	Modulus of elasticity of the spindle material	N/mm ²
R_e	Yield point of the spindle material	N/mm ²
e	Mass eccentricity	mm
ρ_s	Specific density of spindle material	g/cm ³
ρ_k	Specific density of the abrasive product	g/cm ³
K_m	Reducing factor of mass ^a	—
m_{sr}	Reduced mass of spindle ^b	g
m_k	Mass of mounted point without spindle	g
m_s	Mass of spindle	g
L_s	Spindle length inside abrasive product — for cylindrical shape ($L_s = 0,5 T$) — for all other shapes ($L_s = 0,4 T$)	mm
S_a	Diameter of spindle inside the abrasive product ($S_a = S_d$) for plain spindle	mm

^a K_m is calculated with following formulae:

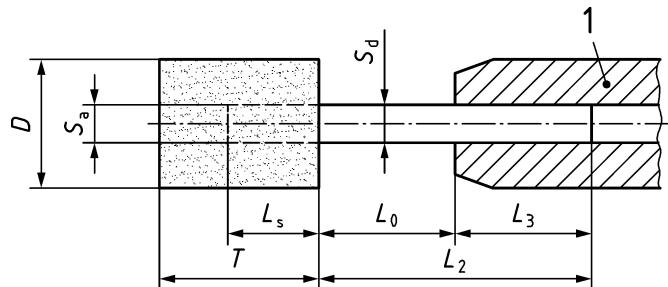

$$K_m = \frac{\frac{33}{140} + \frac{1239}{6720} \cdot \frac{m_s}{m_k}}{1 + \frac{3}{4} \cdot \frac{m_s}{m_k}}$$

^b m_{sr} is calculated as follows:

$$m_{sr} = K_m \cdot \pi \cdot \frac{S_d^2}{4} \cdot \rho_s \cdot (L_0 + L_s) \cdot 10^{-3}$$

Annex C
(normative)

Verification methods for side load capacity

C.1 General

Verification of compliance with the requirements for side load capacity according to 5.2.3 is effected with the following methods. For all methods, the abrasive product under test is mounted to a rotating spindle by means of flanges. The flanges have the dimensions given in Table C.1.

Table C.1 — Outside diameters of flanges for mounting abrasive products for the determination of the side load capacity

Type of abrasive product	Outside diameter D mm	Type of machine	Outside diameter of flanges D_F mm
Depressed-centre grinding wheels, straight and depressed-centre cutting-off wheels	115 ≤ D ≤ 230	Hand-held machines	41
	300		100
	350/356		117
	400/406		133

C.2 Single point side load

The rotating abrasive product is laterally loaded by means of a live pressure roll steadily fed in the direction of the axis until rupture (Figure C.1). The pressure roll has an outside diameter between 70 mm and 80 mm, a width of 25 mm and a convexity of 25 mm. It is engaged to one of the lateral faces of cutting-off wheels and to the working face of depressed-centre grinding wheels. The distance R between the point of application of the force of the pressure roll and the axis of rotation of the abrasive product is given in Formula (C.1):

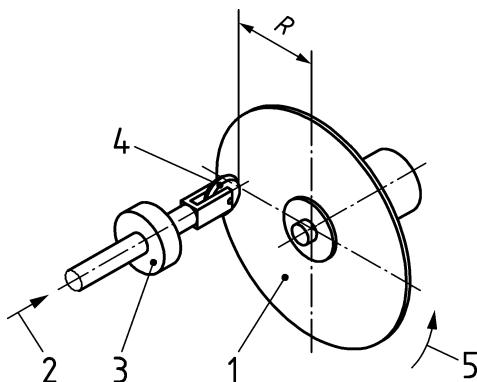

$$R = \frac{D}{2} - 18 \quad (\text{C.1})$$

Where

R is the distance, expressed in mm

D is the outside diameter, expressed in mm

The abrasive product shall rotate with the specified maximum operating speed. The pressure roll is applied with a feeding rate of 3 mm/s until rupture of the abrasive product. The force acting on the pressure roll in the feed direction, the single point side load F_{S1} , is measured.

Key

- 1 Abrasive product
- 2 Feed
- 3 Load cell
- 4 Pressure roll
- 5 Direction of rotation

Figure C.1 — Single point side load test

The pressure roll (4) in Figure C.1 shall be manufactured according to the drawing in Figure C.2. Before commencing a single point side load test, the pressure roll should be checked for wear. For wheels with $D \leq 150$ mm, wear should be ≤ 1 mm of roll diameter, for wheels with $D > 150$ mm, wear should be ≤ 3 mm of roll diameter.

Dimensions in millimetres

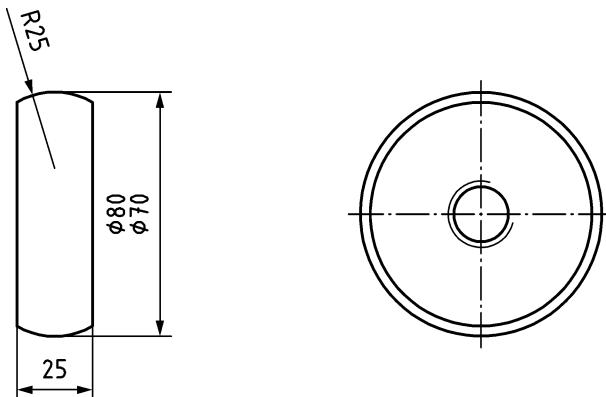

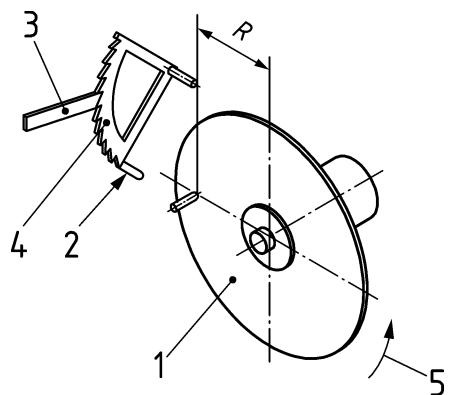

Figure C.2 — Pressure roll

C.3 Impact test

The rotating abrasive product is laterally loaded with one or several impacts supplied successively by means of a pendulum testing machine until rupture (Figure C.3). The pendulum testing machine consists of a frame, inside which a pendulum with striker and, if necessary, additional mass, is mounted. Its potential working capacity is adjustable in 50 steps up to 20 Nm (without additional mass) or 42 Nm (with additional mass). The force is applied by means of a striker with a diameter of 30 mm, an unsupported length of 115 mm and a maximum radius of 40 mm. The striker is engaged to one of the lateral faces of cutting-off wheels and to the lateral face used for grinding of depressed centre grinding

wheels. The distance R between the point of application of the striker of the pendulum testing machine and the axis of rotation of the abrasive product shall be as given in the aforementioned Formula (C.1).

The abrasive product rotates with the specified maximum operating speed and is at first loaded with the required minimum working capacity values required in Table 5 and inspected for visible damages. If no damage is visible to the naked eye, the test is repeated with higher working capacities to be set on the pendulum testing machine. Both the highest working capacity at which still no visible damages have occurred and the working capacity of the next higher grade and the resulting damages are being determined.

Annex D
(informative)

Colour codes

Colour codes can be used as additional marking of the maximum operating speed, see Table A.1. If they are used, the requirements of Table D.1 shall be met. Colour codes shall only be applied for the discrete speed values given in Table D.1. Intermediate speeds shall not have a colour stripe.

Table D.1 — Colour codes and design of colour codes

Maximum operating speed v_s m/s	Colour code		
	Number and colour	Width of colour stripe	Width of gap
50	1 × blue		
63	1 × yellow		
80	1 × red	5 mm to 20 mm	—
100	1 × green		
125	1 × blue 1 × yellow	5 mm to 20 mm each	at least 2 mm, not greater than width of a colour stripe

Colour code stripes shall extend through the centre and across the whole diameter of the abrasive product or the label. They shall be straight and of even width. Any of the coloured markings on the products shall not be confused with the colour code according to Table D.1.

Abrasive products in magnesite bond shall be marked with a white colour code independently from their maximum operating speeds.

Annex E
(informative)

Speed conversion table

The values given in Table E.1 are not the exact calculated values but recommended values to be used for marking the abrasive products.

Table E.1 — Speed conversion ($16 \leq v \leq 125$)

Annex F
(informative)

Recommended scope of the in-process inspection

It is the responsibility of the manufacturer to ensure that all of his products meet the requirements of this standard where relevant.

Tests shall also be conducted to ensure that the process is under control. The sampling levels shall be determined by the manufacturer at a level suitable to confirm conformance. Tables F.1 to F.3 specify the recommended scope of the in-process inspection. Their application presumes that the bursting speed test and – if necessary – the side load test and impact test were successfully affected as type test and that the production of the abrasive products is carried out under controlled conditions.

Table F.1 — Products requiring only visual inspection

Abrasive product	Type

- [12] ISO 3864-2, *Graphical symbols — Safety colours and safety signs — Part 2: Design principles for product safety labels*

British Standards Institution (BSI)

BSI is the national body responsible for preparing British Standards and other standards-related publications, information and services.

BSI is incorporated by Royal Charter. British Standards and other standardization products are published by BSI Standards Limited.

About us

We bring together business, industry, government, consumers, innovators and others to shape their combined experience and expertise into standards-based solutions.

The knowledge embodied in our standards has been carefully assembled in a dependable format and refined through our open consultation process. Organizations of all sizes and across all sectors choose standards to help them achieve their goals.

Information on standards

We can provide you with the knowledge that your organization needs to succeed. Find out more about British Standards by visiting our website at bsigroup.com/standards or contacting our Customer Services team or Knowledge Centre.

Buying standards

You can buy and download PDF versions of BSI publications, including British and adopted European and international standards, through our website at bsigroup.com/shop, where hard copies can also be purchased.

If you need international and foreign standards from other Standards Development Organizations, hard copies can be ordered from our Customer Services team.

Copyright in BSI publications

All the content in BSI publications, including British Standards, is the property of and copyrighted by BSI or some person or entity that owns copyright in the information used (such as the international standardization bodies) and has formally licensed such information to BSI for commercial publication and use. Save for the provisions below, you may not transfer, share or disseminate any portion of the standard to any other person. You may not adapt, distribute, commercially exploit or publicly display the standard or any portion thereof in any manner whatsoever without BSI's prior written consent.

Storing and using standards

Standards purchased in soft copy format:

- A British Standard purchased in soft copy format is licensed to a sole named user for personal or internal company use only.
- The standard may be stored on more than one device provided that it is accessible by the sole named user only and that only one copy is accessed at any one time.
- A single paper copy may be printed for personal or internal company use only.

Standards purchased in hard copy format:

- A British Standard purchased in hard copy format is for personal or internal company use only.
- It may not be further reproduced – in any format – to create an additional copy. This includes scanning of the document.

If you need more than one copy of the document, or if you wish to share the document on an internal network, you can save money by choosing a subscription product (see 'Subscriptions').

Reproducing extracts

For permission to reproduce content from BSI publications contact the BSI Copyright and Licensing team.

Subscriptions

Our range of subscription services are designed to make using standards easier for you. For further information on our subscription products go to bsigroup.com/subscriptions.

With **British Standards Online (BSOL)** you'll have instant access to over 55,000 British and adopted European and international standards from your desktop. It's available 24/7 and is refreshed daily so you'll always be up to date.

You can keep in touch with standards developments and receive substantial discounts on the purchase price of standards, both in single copy and subscription format, by becoming a **BSI Subscribing Member**.

PLUS is an updating service exclusive to BSI Subscribing Members. You will automatically receive the latest hard copy of your standards when they're revised or replaced.

To find out more about becoming a BSI Subscribing Member and the benefits of membership, please visit bsigroup.com/shop.

With a **Multi-User Network Licence (MUNL)** you are able to host standards publications on your intranet. Licences can cover as few or as many users as you wish. With updates supplied as soon as they're available, you can be sure your documentation is current. For further information, email cservices@bsigroup.com.

Revisions

Our British Standards and other publications are updated by amendment or revision.

We continually improve the quality of our products and services to benefit your business. If you find an inaccuracy or ambiguity within a British Standard or other BSI publication please inform the Knowledge Centre.
